

MIKE SANDERS®

RUST PREVENTION GREASE

Provides cavity protection and under-sealing for blank, corroded and painted sheet metal. It is suited to all types of vehicles, vintage and classic, new and used of all ages. It does not have to be applied by a garage, it can be applied by a "do-it-yourself" enthusiast with the right equipment. The product together with the "hot-application-method" were developed over 35 years ago by Mike Sander. Since then several first ranks in product tests, uncounted protected cars and successful industrial applications.

Directions for Use

Heat to 120°C (250°F). Never leave unattended and always use a Thermometer. Ideally the cavity nozzle and the pressure spray gun should also be slightly pre-heated. Using protective gloves pour the hot grease into the spraygun-container (Note: Cartridge Spray guns are not suitable). Recommended pressure is 100 p.s.i. (5.-7. Bar). Safety precaution similar to paint spraying, (do not inhale, use a mask, vent room, because sprayfog-mixture with air can be explosive). The RUST PREVENTION GREASE can also be applied by brush. Recommended coat thickness is min. 0.5mm. Clean unintentionally sprayed areas with a cleaning agent such as degreaser or equivalent. The vehicle should ideally be treated when dry and the temperature is above 10°C (50°F). To improve the penetration into the seams and corners, heating in a spray booth or with a hot air pistol is possible, although when applied, in the summer months this is not necessary. As a precautionary measure it is recommended to cover the vehicles with a plastic foil and to place for example newspapers underneath the water draining holes in the bodywork. Grease that drops out of the vehicle during treatment can be re-heated and used again. This product is especially effective when used under screws, chrome strips and light fittings. Nuts and bolts that have been treated will undo easily even after years of neglect. An examination of the vehicle in respect of corrosion and if necessary an additional treatment is recommended every 2-4 years. Depending on the amount applied, it is possible that in the summer months small amounts of the grease will drip out of the draining holes.

"But its better to have a grease spot than a rust spot !"

Environmental Protection

This product plays an active role in protecting the environment because vehicles treated with the grease will have a much longer lifecycle. And secondly the application is trendsetting in its approach because it contains no solvents which have to be absorbed into our environment.

Important:

MIKE SANDERS RUST PREVENTION GREASE is a mineral oil based product and should therefore not be allowed to run into the ground water. Wipe up any surplus grease with paper and dispose appropriately. MIKE SANDERS RUST PREVENTION GREASE is intended to prevent corrosion on vehicle bodies and metal construction. Damage can be caused through application in a way that is not intended. The following parts should not get in contact with the material or have to be cleaned if that happens. Also has to be taken care, that those parts don't get in contact with the material through liquidation or creeping ability. For example: Brake-parts, exhaust, parts that get hot, also interior panels, locking and other mechanisms and rubber parts (depending on the rubber-material contact could cause damage).

Because the application of our product lies outside our control we can only guarantee the quality of the product itself.

Press Reports:

Autobild Nr. 10, 08.03.2002:

....." The Reference product has a name: Mike Sander ".....

....."A ray of hope: In the metal boxes treated with MIKE SANDERS RUST PREVENTION GREASE the corrosion has been effectively stopped. Over the three year test period the rust tried in vain to bite into the treated surfaces and cavities. Also the seam penetration was convincing and the spread-ability into every part of the box even after three years was guaranteed denying the rust a foothold".....

....."Special grease will be heated to 120° Celsius and applied to the cavities. Even after years still very good creeping ability. Almost insensitive against road salt influence. No retreatment was necessary".....

Motor Klassik Spezial Nr.7:

....."Today, three years on, we know that Mike Sander was right: His product that had lost points in the first year (second place) because of its relatively slow spreading ability, has now in the long term test beaten off all the competition. It was the only material that could reasonably protect the bolting flanges".....

....."MIKE SANDERS RUST PREVENTION GREASE is the clear winner of the cavity protection long term test".....

Evidently in the warmer seasons this product awakes from hibernation and spreads into the seams and cavities, repairing rust spots and cracks in the treated areas even when they were several mm wide. When the metal boxes were opened MIKE SANDERS RUST PREVENTION GREASE had expanded into every corner and crevice".....
